

Guide for transformation from SECRET model to Feature model in VariaMos framework

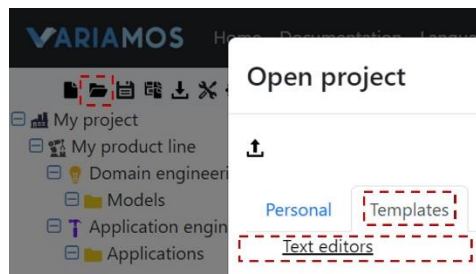

This is a guide to generating a feature model from a requirements model expressed in SECRET of a text editor product line.

Steps

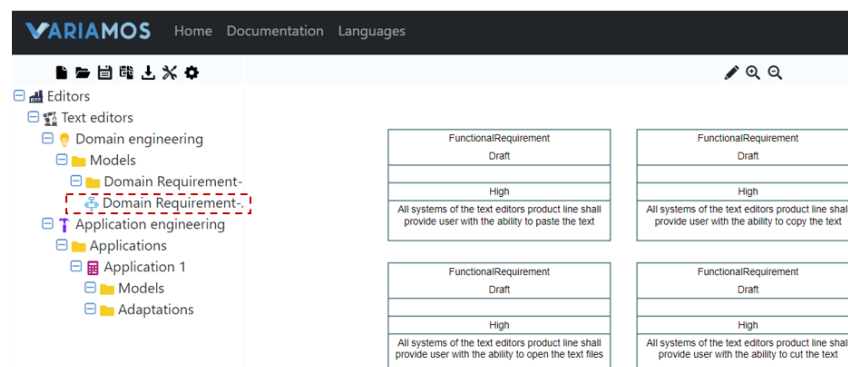

1. Go to [VariaMos Framework](#)
2. Log in as a guest or register using a Google account as shown in the image.

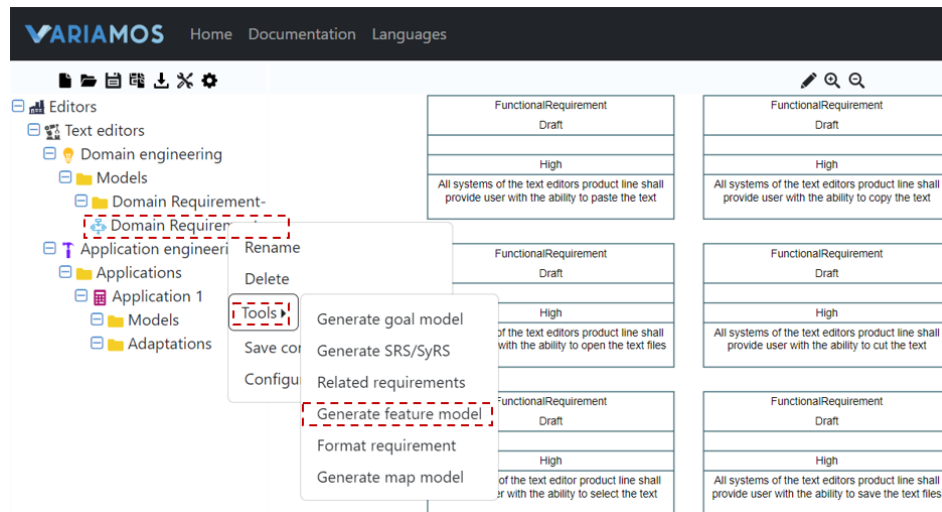

3. Select the *Open project* option (Folder icon), then navigate to the *Templates* tab and select the Text Editors project, as shown in the image.

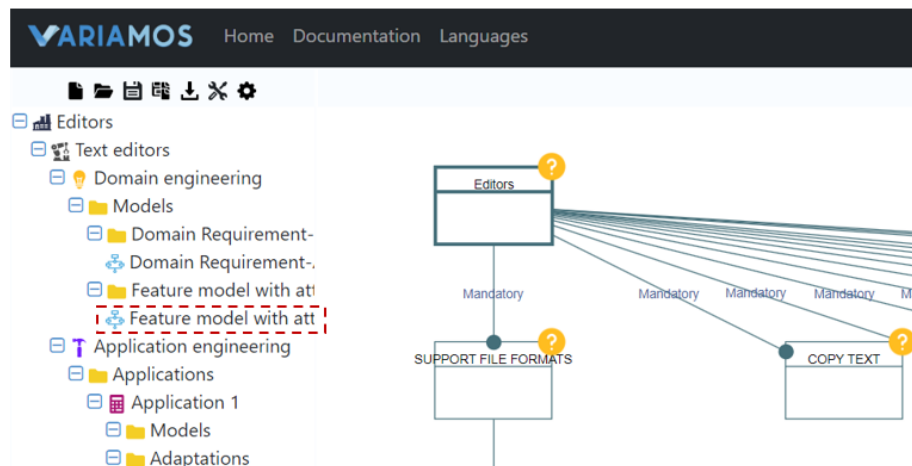

4. Navigate the project explorer and select the SECRET model containing the requirements, as depicted in the figure.

5. To transform the SECRET model into a Feature model with attributes, right-click on the Domain Requirements item in the Project explorer, select *Tools*, and choose *Generate Feature Model*.

6. After the process is complete, select the generated Feature model in the Project explorer for visualization.

7. For configuration of the feature model, you can edit the features' attributes by double-clicking on the feature.
